

AG300
AirLine Synth Guitar System

AG300 AirLine Synth Guitar System

The AG300 guitar transmitter is a unique, dual mount jack that works on either Gibson® or Fender® style outputs. Containing a precision guitar preamp, the AG300 ensures that any guitarist's tone stays "pure as the wire" with no unwanted color or distortion.

An easy-to-read digital channel readout, low battery indicator and mute switch for "hot swapping" are on-board. Additionally, a "set and forget" attenuation switch for active pickups and attenuation level are under the battery cover. For multiple instruments, you can even mount up to four receivers in a rackspace and secure an AG300 transmitter to each guitar for the instant switch from one to another.

AR300 – AirLine Synth Receiver

This system also includes the AR300 AirLine Synth Receiver. Roadworthy durability and crystal clear reception in any location make this receiver an intelligent choice for discerning professionals. Featuring automatic RF scanning and infrared programming, balanced and unbalanced outputs, as well as front or rear mountable antennae, the AR300 is loaded with innovation and convenience. It is also designed with a backlit LED front panel display that shows AF/RF levels, frequency, audio output level and group for easy setup on the fly. The AR300 can also be installed with up to four receiver modules the AR4-300 Quad Module Rackmount.

FEATURES

AG300

- > Plug-in micro guitar transmitter, no belt-pack
- > Frequency-agile synthesized tuning with over 300 channels
- > IR transmitter channel set
- > LCD display
- > Mute switch
- > 15dB pad for hot pick-ups
- > Gain control
- > Low battery indicator
- > 1/4-inch gold jack convertible for Fender® or Gibson® style guitars

AR300

- > Frequency-agile synthesized receiver with over 300 channels
- > Automatic Channel Scan to select the clearest frequency
- > Infrared transmitter channel set
